Brief Industrial Profile of Jhabua District

1. General Characteristics of the District

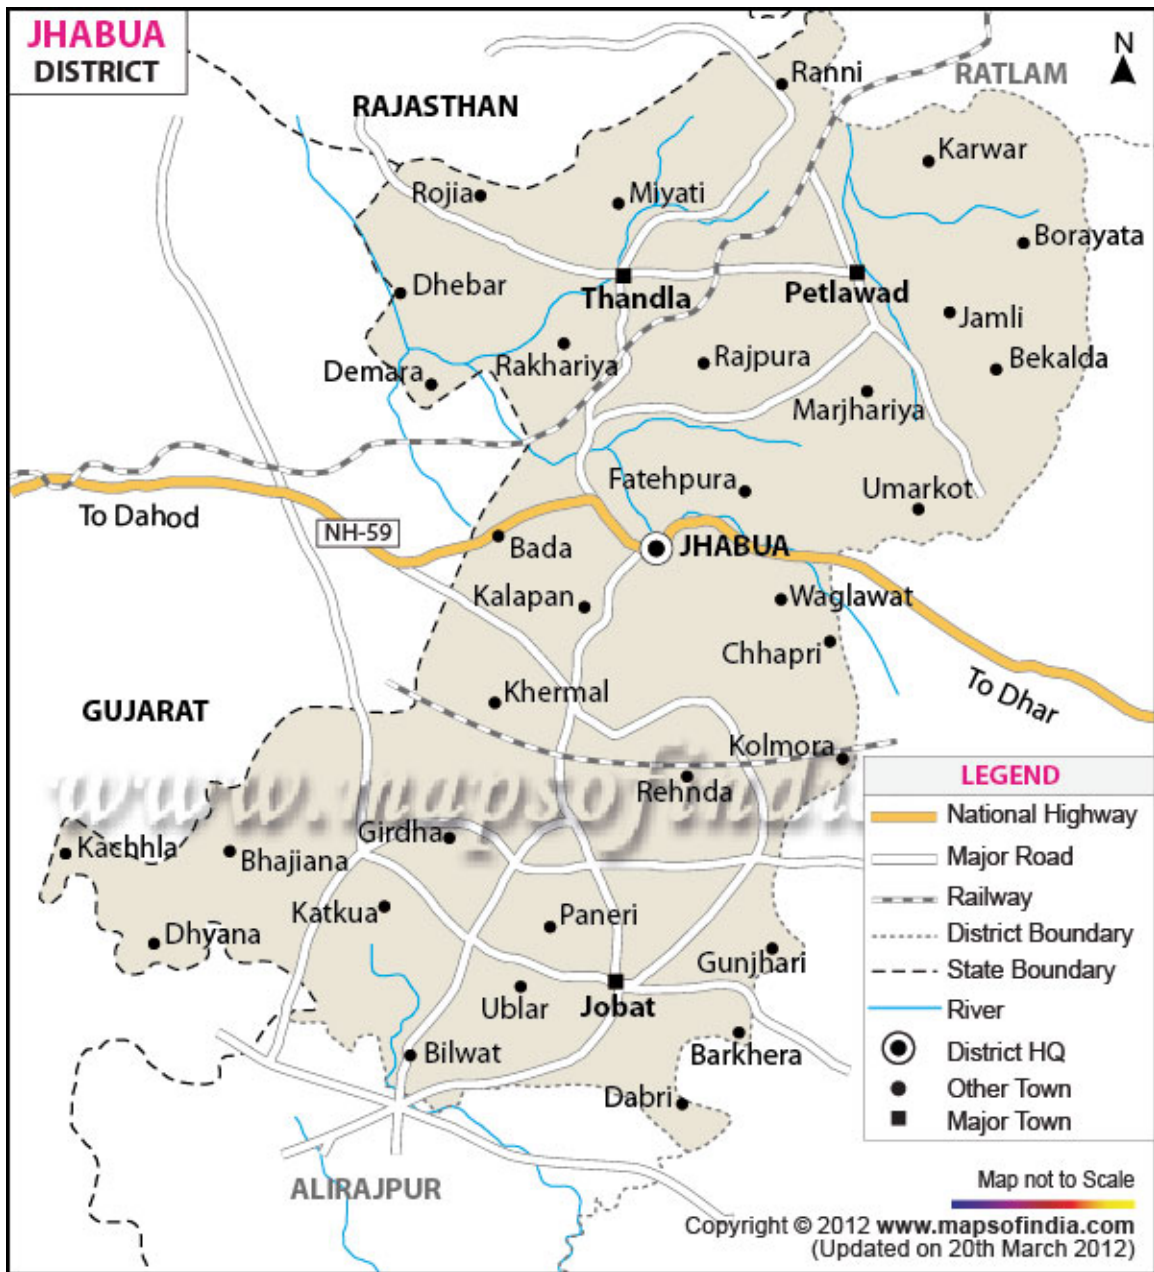

Jhabua was the capital of a princely state of the British Raj Central India, in the Bhopawar agency. Its area, with the dependency of Ratanmal, was approx 1,776 square miles (4,600 km²). After India's independence in 1947, its rulers acceded to India, and

Jhabua became part of the newly created Madhya Bharat state, which in 1956 was merged into Madhya Pradesh. Bhabhara which was once part of the Jhabua district, is the place where Chandrasekhar Azad, the great freedom fighter spent his early life when his father Pandit Sitaram Tiwari was serving in the erstwhile estate of Alirajpur. But, when Alirajpur district (which was once the part of Jhabua district) got separated from Jhabua. Bhabhara became the part of Alirajpur district.

1.1 Location & Geographical Area.

Jhabua district lies in the western part of Madhya Pradesh. It is surrounded by Panchmahal and Baroda districts of Gujarat, Banswara district of Rajasthan, and Alirajpur, Dhar and Ratlam districts of Madhya Pradesh.^[1]

It has an area of 3,782 km².

1.2 Topography

The district's topography is hilly, undulating in a typical fashion known locally as "Jhabua hills topography." As a result, this undulating and uneven terrain does not lend itself to much agricultural productivity. In this type of topography, the difference between the highest and lowest points vary, usually averaging to about 20 to 50 meters. The difference, however, increases as one goes further south. The areas are almost entirely hilly, intersected by narrow valleys and low ranges covered by jungles, as common in Vindhayan topography. The south drains to the Narmada River.

The land is mostly erratic with low fertility, resulting in a lack of forest cover. The top soils are mostly light, with some patches of fertile, medium black variety. These are somewhat threatened by soil erosion and, with the failure of rains at times, can cause vegetation to become sparse. The underlying rock structure is mostly archaean igneous with some deccan trap basaltic and sedimentary formations. Due to the low permeability and porosity of the formations, the groundwater aquifers have poor retention capabilities, resulting in a severe lack of vegetation in most areas.
